TOWN OF WINDSOR

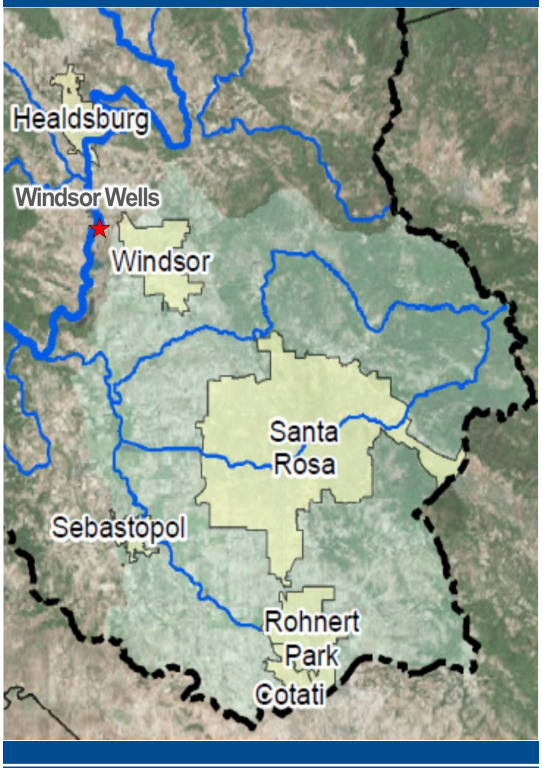

2022 Consumer Confidence Report

Water Quality

our watershed >>>

Map of the southern Russian River watershed (dashed line) with the Laguna-Mark West sub watershed (light green) encompassing Windsor, Santa Rosa, Sebastopol, and Rohnert Park. The Windsor Well Field is located near the Russian River.

Where does my water come from?

The Town of Windsor takes great pride in providing high-quality drinking water to the residents and businesses in our community. As in previous years, and as shown in this report, laboratory testing demonstrates that Windsor supplies drinking water that exceeds the Federal Environmental Protection Agency's (USEPA) and State Water Resources Control Board Division of Drinking Water (DDW) standards.

The Town consistently tests drinking water quality for all regulated constituents to comply with all State and Federal regulations. The tables in this report provide the results of this testing. Windsor's drinking water meets or exceeds all water quality standards set by the USEPA and DDW.

The Town's water supply is derived from two sources. The majority of Windsor's drinking water is pumped from wells near the Russian River into the water distribution system. Some water is also purchased from the Sonoma County Water Agency's Santa Rosa Aqueduct and combined with the Russian River Well Field water for delivery to residents and businesses through over 140 miles of the water distribution system. The system also includes elevated water storage tanks and large diameter mains. This method, which leverages gravity, reduces energy use and contributes the reliability of our water supply.

Windsor's water supply is naturally high quality. As a result, only chlorine disinfection is required to meet drinking water standards. The pH of the water is adjusted to protect the Town distribution and home plumbing systems from the natural effects of corrosion.

director's note >>>

Message from the Public Works Department

Water is a popular subject these days, especially in California where it seems there's either not enough or too much. One thing I know for sure is that no matter the season, our Public Works employees are always in the process of ensuring that Windsor consistently delivers high-quality water to your tap that is safe to drink and accessible to everyone.

But Windsor employees don't do this alone. You partner with them by cherishing and protecting our watersheds, using water wisely, and actively participating to keep our community safe and healthy. In 2022 Windsor used over 20% less water than 2020. That is outstanding and I commend you all for being so diligent with our shared precious resource!

Water quality and the safety of our customers and community are top priorities in Windsor. Our team of highly skilled water operators take great pride in maintaining our system that consistently provides residents with high-quality drinking water. I am proud to report that our system continues to meet all U.S. EPA and State drinking water health standards.

Thank you for taking the time to review the Town of Windsor's 2022 Water Quality Report. I hope you enjoy learning about the excellent quality of Windsor water, and the activities of our water conservation and storm water programs, which are also essential to ensuring we have a clean, reliable water supply.

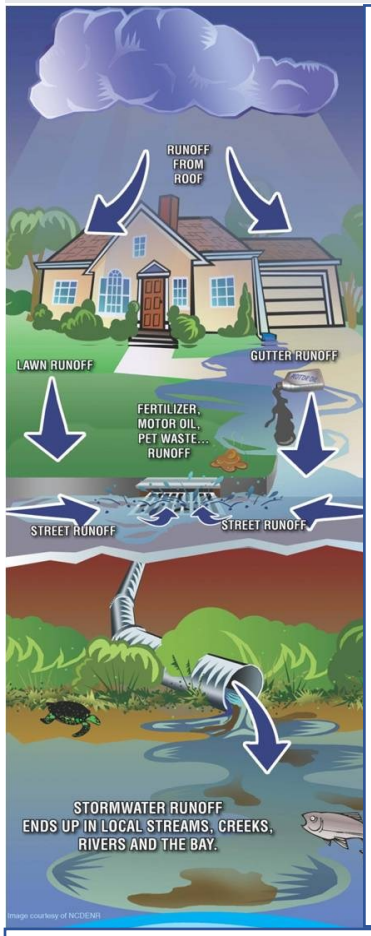

Sincerely,
Shannon Cotulla, Public Works Director, Town of Windsor

seasonal irrigation reminder

Summer is here, and so is warmer weather. Before you switch on your automated irrigation system, make sure it's working properly and regularly maintained:

- Replace the back-up battery in your timer to ensure your schedule is not erased during a power interruption.
- Make sure the sprinklers are only spraying your plants and not the sidewalk, driveway, or street.
- Adjust the watering schedule to reflect changes in weather; less water is needed in spring and fall.
- Look for a QWEL certified professional (https://www.qwel.net/) to keep your landscape thriving while minimizing water use.

Remember, water conservation is a California way of life!

Stormwater Runoff Carries Pollutants with it as it flows off our rooftops, lawns, driveways, and sidewalks. Litter, car fluid leaks, pet waste, and other pollutants are carried with rainwater into our creeks ***Untreated*** - storm drain systems are designed for flood control, not water treatment. ***Pollutants*** that ***Enter Our Storm Drains*** not only travel directly to our creeks, but also to the Russian River and the ocean. These pollutants ***Harm Wildlife and us!***

Please, ***Do Your Part*** to keep Windsor's streets and creeks clean and healthy!

Please, report spills and illegal dumping immediately!
Windsor Engineering Division of Public Works

frequently asked questions >>>

Q: What is the hardness of my water?

A: Hardness is the amount of calcium carbonate in water. Windsor's water source contains moderately high calcium carbonate. However, modern detergents and cleaning products are formulated to create suds and disperse cleaning agents, even in hard water. Aesthetic impacts, such as water spotting and fixture deposits, can be managed with routine housekeeping practices.

Q: What is PFAS? Should I be concerned?

A: PFAS is a "forever chemical" found in many products like food wrappers, flame retardant clothing, non-stick cookware, and cosmetics. It has been found to have adverse health effects at low levels of exposure. The EPA will soon be requiring drinking water suppliers to test for PFAS. The Town of Windsor has already begun this process and has completed the first round of testing. For more information, visit our website: https://www.townofwindsor.com/1429/PFAS

Q: What do I do if I notice a water leak?

A: Town staff are on call 24/7 to respond to emergencies. Call 707-838-1004 to report a leak. Town staff will receive your call during business hours. After business hours, your call will be directed to an answering service that will notify on-call Town staff to respond to the concern.

TABLE OF DETECTED SUBSTANCES FOR 2022 REPORT

Sampling Results for Lead and Copper: Tap Water Samples Collected Throughout the Community

Substance	Year Sampled	90th Percentile Level Detected	Number of sites exceeding AL	AL	MCLG	Number of Schools Requesting Lead Sampling	Typical Source of Contaminant	Violation?
Lead (ppb)	2022 (33 samples)	ND	0	15	0.2	0	Internal corrosion of household water plumbing systems; discharges from industrial manufacturers; erosion of natural deposits	No
Copper (ppm)	2022 (33 samples)	0.798	1	1.3	0.3	N/A	Internal corrosion of household plumbing systems; erosion of natural deposits; leaching from wood preservatives	No

Primary Substances (PDWS) and Regulated Substances

Substance	Year Sampled	Average Level Detected	Range of Detections	MCL	PHG	Typical Source of Contaminant	Violation?
Barium (ppm)	2020, 2022	0.06	<0.10 – 0.13	1	2	Discharges of oil drilling wastes and from metal refineries; erosion of natural deposits	No
Total Haloacetic Acids (ppb)	2022	0.8	1.0 – 1.6	60	N/A	Byproduct of drinking water disinfection	No
Total Trihalomethanes (ppb)	2022	15.74	10.21 – 21.27	80	N/A	Byproduct of drinking water disinfection	No

List of Acronyms and Definitions	
Public Health Goal (PHG)	The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.
Maximum Contaminant Level (MCL)	The highest level of a contaminant that is allowed in drinking water. Primary MCLs are set as close to the PHG (or MCLGs) as is economically and technologically feasible. Secondary MCLs are set to protect the odor, taste, and appearance of drinking water.
Maximum Contaminant Level Goal (MCLG)	The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs are set by the U.S. Environmental Protection Agency.
Primary Drinking Water Standards (PDWS)	MCLs, MRDLs and treatment techniques (TTs) for contaminants that affect health, along with their monitoring and reporting requirements.
Secondary Drinking Water Standards (SDWS)	MCLs for contaminants that affect taste, odor or appearance of drinking water. Contaminants with SDWS's do not affect health at the MCL levels.
Regulatory Action Level (AL)	The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.
Maximum Residual Disinfectant Level (MRDL)	The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.
Maximum Residual Disinfectant Level Goal (MRDLG)	The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

TABLE OF DETECTED SUBSTANCES FOR 2022 REPORT

Secondary Substances (SDWS) and other unregulated substances*

Substance	Year Sampled	Average Level Detected	Range of Detections	MCL	Typical Source of Contaminant	Violation?
Turbidity (NTU)	2020, 2022	0.015	0.021 – <0.25	5	Soil Runoff	No
Hardness (mg/L)	2020, 2022	124	114 – 141	N/A	Naturally occurring cations present in water, generally magnesium and calcium	No
Sodium (mg/L)	2020, 2022	10.8	9.6 - 12	N/A	Refers to the salt present in the water and is generally naturally occurring	No
Total Dissolved Solids (ppm)	2020, 2022	144	140 – 160	1,000	Runoff/leaching from natural deposits	No
Specific Conductance (µS/cm)	2020, 2022	277	250 - 320	1,600	Substances that form ions when in water; seawater influence	No
Chloride (ppm)	2020, 2022	7.0	5.8 – 9.2	500	Runoff/leaching from natural deposits; seawater influence	No
Sulfate (ppm)	2020, 2022	14	13 - 16	500	Runoff/leaching from natural deposits; industrial wastes	No

There are no PHGs, MCLGs, or mandatory standard health effects language for these constituents because secondary MCLs are set on the basis of aesthetic concerns.

Section 64450 of the California Code of Regulations requires certain water systems to monitor for unregulated contaminants. The Federal Unregulated Contaminant Monitoring Rule (UCMR4) required the Town of Windsor to monitor for these unregulated contaminants in 2019. Samples were collected as untreated source water (Raw Water), Treated Water, and Distribution System Water. The results below are only for substances that were detected.

UCMR4 Unregulated Substance Monitoring (2019)

Substance Detected	Average Result (ppb)	Result Range (ppb)
Bromide	42.3	42.3
Bromochloroacetic acid (BCAA)	0.823	0.733 – 0.913
Bromodichloroacetic acid (BDCAA)	0.785	<0.500 – 1.07
Chlorodibromoacetic acid (CDBAA)	0.635	0.465 – 0.805
Dibromoacetic acid (DBAA)	0.854	0.608 – 1.10
Dichloroacetic acid (DCAA)	0.587	0.449 – 0.725
Trichloroacetic Acid (TCAA)	0.746	<0.500 – 0.991

List of Acronyms and Abbreviations

State Water Board	State Water Resources Control Board
N/A	Not applicable
NTU	Nephelometric turbidity units
ppm	Parts per million or milligrams per liter (mg/L) Example: 1 second in 11.5 days.
ppb	Parts per billion or micrograms per liter (mg/L) Example: 1 second in nearly 32 years.
µS/cm	micromhos per centimeter

The above tables list all the drinking water contaminants detected during the most recent sampling for the constituent. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. The State allows us to monitor for some contaminants less than once a year because the concentrations of these contaminants do not change frequently. Some of our data, though representative, are more than a year old.

Source Water Information

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material and can pick up substances resulting from the presence of animals or from human activity.

- Microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations and wildlife.
- Inorganic contaminants, such as salts and metals, that can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas productions, mining or farming.
- Pesticides and herbicides, that may come from a variety of sources such as agriculture, urban storm water runoff and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, that are byproducts of industrial processes and petroleum production, and can also come from gas stations, urban storm runoff, agricultural application and septic systems.
- Radioactive contaminants, that can be naturally occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the US Environmental Protection Agency (USEPA) and the State Water Resources Control Board (State Water Board) prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. The U.S. Food and Drug Administration regulations and California law also establish limits for contaminants in bottled water that provide the same protection for public health.

- Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of contaminants.
- The presence of contaminants does not necessarily indicate that water poses a health risk. More information can be obtained by calling the USEPA's Safe Drinking Water Hotline (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immune-compromised persons such as persons with cancer undergoing chemotherapy, persons who have under gone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. USEPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline at 1-800-426-4791.

your water quality staff >>>

Water Operations Crew

***Julie Davis**, Lab Analyst*
***Adrienne Cibor**, Environmental Program Manager*

Water Operations

A staff of trained and certified water operators work hard to ensure Town of Windsor residents are provided with safe and reliable drinking water. Water operators are responsible for the operation and maintenance of the Town's water distribution system including weekly sampling, small and large leak repair, backflow testing and preventative maintenance to the Town's infrastructure. Other tasks include:

- Annual well maintenance
- Cross-connection control testing
- Flushing & hydrant flow testing (pictured below)
- Responding to water emergencies including broken water lines or damaged fire hydrants.

Windsor is grateful to have such an amazing team of water operators!

Windsor Water Operators performing hydrant flow testing

information on lead>>>

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The Town of Windsor is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you do so, collect the flushed water and reuse it for another beneficial purpose, such as watering plants. If you are concerned about lead in your water, you may wish to have your water tested. Information on testing methods and pathways of exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/lead.

Water Conservation

Home landscapes that are both beautiful and water efficient are what Windsor is all about! By replacing lawns with native, drought tolerant plants and organic mulch, we can ensure our community has resilient, water-wise, and pollinator friendly landscaping.

Need inspiration for your home landscape? Visit the Sonoma-Marin Saving Water Partnership online at http://www.savingwaterpartnership.org/concept-plans-and-design-templates/ to access free landscape design plans, a helpful Water Smart Plant Picker tool, and virtual tours of local gardens.

Need some financial help to create a water-efficient landscape? Take advantage of the Water-Efficient Landscape (WEL) Rebate! The Town of Windsor offers this rebate for the removal of turf grass or for the purchase of lawn sprinkler equipment upgrades that improve the efficiency of your irrigation system. Raising your system's efficiency reduces the amount of water needed to maintain a healthy landscape and may reduce your water bill. You can make your landscape even more water efficient by removing your lawn and replacing it with drought-tolerant plants watered by a drip irrigation system. You can even choose plants that support butterflies and other pollinators. **Participation in this program requires a pre-approval inspection prior to the start of work. Call (707) 547-1909 to make an appointment.**

Visit https://www.townofwindsor.com/1414/Rebates-and-Incentives to learn more about the program guidelines.

TOWN OF WINDSOR

Did you know...

Did you know the Town of Windsor has a Recycled Water Program?
Recycled water is wastewater that has been cleaned and treated in order to remove contaminants and pollutants for safe usage in a variety of different settings, including landscape and street median irrigation and flushing toilets. To learn more about Windsor's Recycled Water Program, please **visit** https://townofwindsor.com/recycledwater.
